

Macro planning

SYNTHETIC VIEW OF THE PROGRESS OF THE PROJECT PHASES

What is a macro planning?

Macro planning is a tool that helps to define the major phases and important milestones of the project. It is useful for external communication needs.

If the project team needs a detailed schedule, the communication with the steering committees must have a schedule with a "helicopter" view, that summarizes the major phases of the project.

When to use it?

INITIATION PHASE

During the initiation phase of the project, we will need to present a macro estimate of the deadlines to be attached to the project charter.

The plan presented will give an estimated view of each main phase of the project and the milestones associated with it, from a macro view.

How to use it?

- Concretely, a meeting is organized with a panel of experts to define a logical network diagram which will serve as a basis for the macro-planning
- For simple projects, this shouldn't take long
- The example of the "CMRL" case study will guide you in filling in your data

Document structure

- Standard macro planning of a project
- Example of an agile macro planning
- Example of a macro planning
